## PREFACE

Why a six-place table? The teacher of conventional mathematics who endeavors to impart a knowledge of theory through the use of the artificial problem whose data are fictitious or " contrary to fact," can have no answer to this question. In problems of this type the results obtained by solution have no part in human industry and it is immaterial whether they are expressed in three figures or in more. If interpolated alike, a three-place table is therefore as good as a five or greater wlace for such computation, and even better, because necessitating the use of fewer figures.

In industrial and technical problems, however, the result is of supreme mportance and the number of figures is fixed by standard practices of manufacture. In simple logarithmic computation which does not involve the $\log \log$ or transitions from non-tabular to tabular, it is a wellknown fact that the result is correct, in any event, to within one less significant figure than the number of places in the table. If, therefore, as frequently is the case, a result must be exact to the fifth significant figure, a six-place table, and no less, is a necessity.

In the preparation of these tables, no pains have been spared to have them accurate. Some two hundred students have assisted in the reading of the proofs and no page has been read by less than ten different persons, with six-, seven-, and eight-place tables. The table of circular arcs was computed by over one hundred students and checked until all results agreed.

Attention is called to the use of heavy ruling instead of the usual devices for denoting the change in leading figures when occurring in
the line, thereby making the use of the wrong leading figures possible only by " jumping the fence."

Students and others desiring more detailed information regarding the use of the tables than is contained in the introductory pages are referred to the extensive chapter on Logarithms and Logarithmic computation in the author's " Technical Algebra."

## INSTRUCTIONS FOR USE OF THE TABLES

## § ı. TABLE OF LOGARITHMS OF NUMBERS

What a Logarithm is. The notion of a logarithm is probably most easily reached by a study of the integral, consecutive powers of io shown below:

$$
\begin{array}{ll}
10^{4}=10000 & 10^{\circ}=\mathrm{I} \\
10^{3}=1000 & 10^{-1}=.1 \\
10^{2}=100 & 10^{-2}=.01 \\
10^{1}=10 & 10^{-3}=.001
\end{array}
$$

Observe that the powers of io decrease by unity, and that each number obtained by raising to to the power indicated is therefore one-tenth of the preceding number.

To multiply $10^{3}$ by $10^{2}$ it is only necessary to add the exponents 3 and 2 , giving $10^{5}$, and therefore 1 followed by 5 ciphers, giving 100000 . Suppose now we wish to multiply 12.78 by 980.7 by adding exponents of ro. Locating the two numbers with respect to the integral powers of ro, we have

$$
\begin{aligned}
& 10^{2}=100 \\
& 10^{3}=1000 \\
& 12.78 \\
& 10^{1}=10 \\
& 10^{2}=\begin{array}{l}
980.7 \\
100
\end{array}
\end{aligned}
$$

Observe that 12.78 is slightly greater than the first power of 10 and that 980.7 is almost equal to the third power of 10.

Therefore
And
$12.78=10^{1+\mathrm{a} \text { small decimal, }, ~}$
$980.7=10^{2+a}$ large decimal.

## A table of logarithms is a table which contains the decimal parts of the powers of 10 for all numbers.*

The decimal parts (called mantissas), for 12.78 and 980.7 , are read as follows:

To read the mantissa of the logarithm of $12.7^{8}$
(I) Move the index finger of the left hand down the N -column of the table of the Logarithms of Numbers until it is under 127.
(2) Move the finger along the horizontal to the 8 -column.

The four figures in the 8-column are the last four figures of the 6-place decimal part of the power of 10 , which equals 12.78 , the first two figures of the decimal being in the $\mathbf{O}$-column.

Thus

$$
12.78=10^{1.106531}
$$

The reading for 980.7 is made in the same way, as follows:
(1) Index finger under 980 in N -column;
(2) Index finger moved to right along horizontal to 7 -column.
(3) To the four figures in the 7 -column are prefixed the first two in the $\mathbf{O}$-column.

Thus

$$
980.7=1 \mathrm{o}^{2.991536}
$$

Observe that the decimal was read in both cases in the column headed by the fourth figure of the number, and in the same line as the first three figures of the number in the N -column.

Readings are always made in the same way, regardless of whether a number has four significant figures, or less than four, or more than four, and regardless of the decimal point.

Thus

$$
\begin{gathered}
5762=10^{3.760573} \\
5.762=10^{.760573} .
\end{gathered}
$$

When a number has less than four significant figures, enough ciphers are considered annexed to make four figures.

Thus 3 I is read as 3100 ;
7 is read as 7000.
When a number has more than four significant figures, the reading Is taken for the first four only, and additions are made to the reading as explained in the paragraph on Proportional Parts.

[^1]Therefore observe:
(I) A logarithm is an exponent of io. For any particular number a logarithm is the exponent which denotes the power to which io must be raised to equal the number.
(2) A table of logarithms of numbers is a table of the decimal parts of the powers of ro for any positive numbers.
(3) When a number is greater than unity, the integral part of the power of 10 is always one less than the number of integral figures in the given number.

Thus 980.7 has three integral figures; the integral part of the logarithm is 2.
12.78 has two integral figures; the integral part of the logarithm is $\mathbf{I}$.
(4) When a number is less than unity, (decimal), the integral part of the power of so equals minus the number of the decimal place of the first significant figure of the given number.

Thus

$$
\begin{aligned}
. \mathrm{I} & =1 \mathrm{I}^{-1} ; \\
. \mathrm{OI} & =1 \mathrm{I}^{-2} ; \\
.0043 & =1 \mathrm{O}^{\overline{3} .633468} .
\end{aligned}
$$

(5) The integral part of a logarithm is called the characteristic.
(6) The decimal part of a logarithm is called the mantissa, meaning something added. All mantissas are positive.
(7) The first two figures of a mantissa (called "leading figures ") are in the zero-column. The remaining four figures are in the column headed by the fourth significant figure of the number.

When the last four figures are immediately under the heavy line across the table, the leading figures are in the zero-column under the heavy line.

$$
\text { Thus } \log 83.19=1.92007 \mathrm{I}
$$

## How to Use the Table of Proportional Parts

Required the logarithm of 342.0791 .
The characteristic is 2 .
The mantissa of the logarithm of the first four figures is .534026 .
The difference between the reading in the $\mathbf{I}$-column and the $\mathbf{O}$-column is 127 .

Thus mantissa of $\log 34210=.534153$,
And

$$
" \quad " \log 34200=.534026 \text {. }
$$

Therefore a difference (in numbers) of $10=127$ difference in mantissas. Therefore a difference (in numbers) of $1=.1 \times 127=12.7$ " ، $6 \quad$ " $\quad$ of $2=.2 \times 127=25.4$ " $، \quad$ " $6 \quad 3=.3 \times 127=38.1$, etc.

These tenths of the actual difference between two successive mantissas are given in the table of proportional parts at the bottom of each page.

In that table the numbers at the tops of the several columns are the differences in logs; the proportional part is in the same line as the figure of the number for which proportional part is wanted.

The P.P. table gives the reading for the fifth significant figure of a number whose logarithm is wanted. For a sixth significant figure, the reading, when set down for addition, must be moved one place to the right; for a seventh significant figure, two places to the right, and so on.
$\log 342.0791$ is therefore set down as follows:

| 2.534026 |
| ---: |
| 882 |
| 1 II 34 |
| $2.534 \mathrm{I} 26{ }^{4}$ |

Also the following:
$\log 50034.87: \quad 4.69923 \mathrm{I}$

344
688
602
4.699273
iog .07105029: $\quad \overline{2} .851564^{*}$
122
549
$\overline{2} .851566$
*Minus is placed as shown because only the characteristic, 2 , is negative.

Observe, in the preceding:
(I) Only six decimal figures are retained in the logs because a 6-place table is used. When the seventh decimal figure is 5 or greater, the sixth decimal figure is increased by unity.
(2) Determine actual difference between next greater mantissa and mantissa read, by subtracting last figure of mantissa read from last figure of next larger mantissa; take remaining figures of difference from D-column.
(3) The decimal point in ${ }^{-}$P.P. (proportional parts) reading is used merely to denote that the figure immediately preceding it is the sixth decimal figure of the proportional parts addition. The decimal point is therefore dropped when the proportional part is set down for addition.
(4) A cipher gives no P.P. reading.

## How to Read an Antilogarithm

Since the number of units in a plus characteristic always denotes one more integral figure in the antilog, and the number of units in a minus characteristic denotes the number of the decimal place of the first significant figure in the antilog, an antilogarithm is read from the mantissa only.

Thus
Next smaller mantissa

$$
\begin{aligned}
& \overline{3} \cdot 726593 \\
& \frac{64}{29}={ }^{*} 5328 \\
& \frac{246}{44} \equiv 3 \\
& 4 \mathrm{I} \equiv 5
\end{aligned}
$$

Therefore $\dagger \log ^{-1} \overline{3} \cdot 726593=.00532835$.
Important Suggestions. In the use of the tables, mistakes will be minimized and time saved by observance of the following suggestions:
(1) Make it an invariable practice to set down the characteristic before reading the mantissa.
(2) Locate reading in table by index finger, straightedge, card, or sheet of paper.

[^2](3) Keep index finger in position until reading has been copied, and the copied number checked at least twice with number, column heading, line, and reading.
(4) Use D-column only to help determine the actual difference between successive mantissas as follows:

By inspection, determine difference between last figure of next larger mantissa and last figure of mantissa read; determine remaining figures of difference by the D -column.

If difference thus determined is not in P. P. table, read P. P. under the next smaller difference.

Thus, if difference is 433, which is not in P. P. table, read under 432. This suggestion is given to offset, in a measure, the increase of the sixth figure of the mantissa by unity when the seventh figure is 5 or greater.
(5) Do not attempt to read the logarithm of a minus number. It has no logarithm.
(6) Do not attempt to read an antilogarithm of a logarithm whose decimal part is minus. If minus, it is not in the table, and is therefore a non-tabular logarithm. The integral part of such a logarithm is not a characteristic, nor is the decimal part a mantissa.

When the antilogarithm of a non-tabular logarithm is wanted, reduce the non-tabular to tabular as follows:
(a) Subtract the non-tabular logarithm as a plus number from a number I greater than its integral part;
(b) Write as the characteristic of the logarithm thus obtained, the number from which subtraction was made, with a minus over it.

Thus -2.617309 non-tabular gives $\overline{3}$-382691 tabular.
(7) The general rule, that in logarithmic computation the result is always correct to within at least one significant figure of the number of places in the table used, does not necessarily apply when log logs or transitions from non-tabular to tabular are involved. Therefore in technical computation involving powers and roots, make computation by arithmetic multiplication or division of logarithm.

## § 2. TABLE OF SINES AND COSINES Logarithmic Sines

Read degrees at top, minutes at the left, seconds at top. $A d d$ seconds reading in P.P. table.
Thus $\log \sin 54^{\circ} 2 \mathrm{I}^{\prime} 14^{\prime \prime}$ :

$$
\begin{array}{r}
9.909888 \\
6 \\
\hline 9.909894
\end{array}
$$

## Natural Sines

Degrees at top, minutes at left. Multiply number of seconds by P.P. for $\mathrm{I}^{\prime \prime}$ and $a d d$ to reading.

Thus $\sin 54^{\circ} 2 I^{\prime} 14^{\prime \prime}$ :

| .8 I 2592 |
| ---: | ---: |
| 39 |
| .8 I 263 I |$\quad$| 2.8 I |
| ---: |

## Logarithmic Cosines

Read degrees at bottom, minutes at right, seconds at bottom. Subtract seconds reading in P.P. table.
Thus $\log \cos 54^{\circ} 2 I^{\prime} 14^{\prime \prime}$ :

$$
\begin{array}{r}
9.765514 \\
12 \\
\hline 9.765502
\end{array}
$$

## Natural Cosines

Degrees at botton, minutes on right.
Multiply P.P. for $I^{\prime \prime}$ by number of seconds, and subtract from reading.

## Tangents and Cotangents

Read the same way as sines and cosines, respectively. Observe:
(I) P.P. readings or computations for seconds are always subtracted when reading co-named functions and are added when reading other functions.
(2) The cosine or cotangent of an angle expressed in degrees and minutes, with no seconds, is read under one less number of minutes.

Thus $\cos 72^{\circ} 25^{\prime}$ is read $\cos 72^{\circ} 24^{\prime} 60^{\prime \prime}$.

## §3. TABLE OF CIRCULAR ARCS

Since circumferences are proportional to their radii, arcs are proportional to their radii.

Therefore the length of any given arc in a circle of a given radius may be determined by multiplying the length of the arc of unit radius by the given radius.

Thus:
Required, length arc $21^{\circ} 25^{\prime} 40^{\prime \prime}$ with radius 7 inches.
Length arc $2 \mathrm{I}^{\circ}=.366519 \mathrm{I}$
" " $25^{\prime}=.0072722$
" " 40 " $=.0001939$
${ }^{6}$ total $=.373985^{2}$

How I love to teach a number useful to the wise, Immortal Archimedes, artist engineer! Who can appraise the worth of thy judgment? For me thy problem had equal advantages.

Wie viele tausende bewundern Geister $\begin{array}{lllll}9 & 3 & 2 & 3 & 8\end{array}$
Himmlisch wie Du , und Göttlich!
$4 \quad 6 \quad 2 \quad 6$
Noch reiner in Aeonen
$\begin{array}{llll}4 & 3 & 3 & 8\end{array}$
Wird das uns strahlen
Wie im lichten Morgenrot.

## Translation.

Thee, O Hero, O old Philosopher, thou illustrious Genius,
How many thousand souls admire,
Heavenly as thou and divine!
Yet clearer in the ages
Will that shine on us
Than in the luminous dawn.
